AB The subject invention relates to the identification of genes involved in the desaturation of polyunsaturated **fatty acids** at carbon 5 (i.e., " Δ 5-desaturase") and at carbon 6 (i.e., " Δ 6-desaturase") and to uses thereof. In particular, Δ 5-desaturase may be utilized, for example, in the conversion of dihomogamma-linolenic acid (DGLA) to arachidonic acid (AA) and in the conversion of 20:4n-3 to eicosapentaenoic acid (EPA). Delta-6 desaturase may be used, for example, in the conversion of linoleic (LA) to gamma-linolenic acid (GLA). AB Enteral formulas that contain long-chain polyunsaturated **fatty acids** (PUFAs), e.g., **arachidonic acid** (AA), and docosahexaenoic acid (DHA), essentially free of cholesterol, are described for use in methods for reducing the incidence of necrotizing enterocolitis. Compositions from egg yolk lipids are preferred as they contain ω -6 and ω -3 long chain PUFAs and are predominantly in a phosphatidylcholine form. This is believed to provide a synergetic effect.

AB Enteral formulas that contain long-chain polyunsaturated **fatty acids** (PUFAs) and a process for making such enteral compositions are described. More particularly, the invention relates to enteral compositions which provide long chain PUFAs **arachidonic acid** (AA) and docosahexaenoic acid (DHA) essentially free of cholesterol and may be derived from egg yolk lipids, and thus are predominantly in a phospholipid form. The process of making such a composition provides improved organoleptic and stability properties. AB Stable emulsions characterized by pseudo-"melting" properties are comprised of an oil phase, an aqueous disperse phase, and particles containing an immobilized water-in-oil emulsion destabilizing agent. The emulsions are suitable for use as drug delivery vehicles, cosmetic ointments, and the like, and especially as foods, such as cake frosting bases, desserts ("ice cream") and bread spreads. The physical and organoleptic properties of the emulsions make them especially useful as successors to butter or margarine. In an optional mode, compositions comprising the oil phase and the destabilizing agent are provided. Such compositions interact with extrinsic water (e.g., saliva) and provide palatable, non-waxy shortenings, food spreads, and the like. When used for frying foods, or the like, the water-containing compositions herein foam slightly, and this foaming reduces both spattering and the tendency of food being cooked to undesirably adhere to the cooking utensil.

eicosanoid

Any of a number of biochemically active compounds resulting from enzymic oxidation of arachidonic acid, e.g., prostaglandins, thromboxanes, prostacyclin, and leukotrienes. As a group, they compose what is known as the arachidonic acid cascade. They have many pharmacological and medical possibilities.

See prostaglandin; arachidonic acid.
